

Simulating Brute Force attack on Windows Client using Domain User Account and Verifying Playbook execution

Summary

This document involves steps for Simulating a Brute-force attack on the Windows Client and verifying that alert is triggered from Splunk Enterprise and the SOAR Playbook disables the user via AD LDAP app.

1. Ensure Domain Account credentials are valid

- 1) On **Windows Client**,
Ensure to **login as Domain User** with **right credentials**

2) After logging in, check the user and the domain and then sign out

2. Attempting BruteForce Attack on the Windows Client

1) Attempt to **login** to the **Domain User** account again with **wrong credentials (username/password)** for more than 3 times (>3).

- 2) When trying to login again with the right credentials, your account should be locked out and disabled.

3. Verify that the alert was triggered from Splunk and SOAR has executed the playbook

- 1) In Search Head UI,
Go to Settings > Searches, reports and alerts
Click on "View Recent" of the created alert
You will see the events on the Jobs page and how many times the event was triggered

- 2) In the **Splunk SOAR UI**,
You can see the triggered alert in the **Events section of Dashboard** or Go to
Home > Events

Or Click on the **Events by Status graph**, you should see the alert we set from Search Head has triggered and is sent to SOAR.

- 3) **Login to the AD Server to check the Domain User account status**
In Windows Server,
 - i) Login as **Administrator**
 - ii) Go to **Start > Windows Administrative Tools > Active Directory Users and Computers (ADUC) > NovaSec > Users > Employees**
 - iii) Right-click on the specific user <domain_username>
If you see **Enable account** option in the menu, then the **user was disabled successfully**
